

IFM LYTE

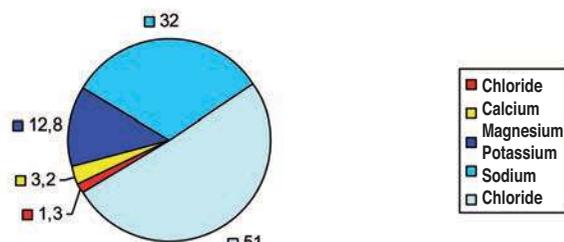

Electrolytes in pellet form for Sport Horses

The hard physical work or prolonged training, especially in hot and humid conditions, causes a rise of temperature to the horse body that must be absolutely kept under control.

The mechanism used by the horse to cool his body is by sweating, that if in one hand is important to lower its body temperature, on the other hand determines a net loss of water and electrolytes.

HORSE SWEAT COMPOSITION (%)

If water and electrolytes are not properly restored the horse can give signs of dehydration, which are reflected in the muscles, with early exhaustion, cramps and difficulty of recovery after training or racing.

As in the body of the horse "there is no possibility to stock electrolytes", it is fundamental to supply them as soon as possible after the effort, so to restore the normal physiological levels.

IFM LYTE provides balanced electrolytes able to enrich the ration of the horse with all these precious elements, which are essential for the welfare of the Sport horse.

The pellet form, allows an easy and efficient administration also to those horses who do not like powdered supplements. In addition, all the product administered is ingested by the horse without any waste.

IFM LYTE

Electrolytes in pellet form for Sport Horses

Composition:

Bran wheat, Sodium Chloride, Potassium Chloride, Calcium Carbonate, Magnesium Oxide.

Analytical components:

Calcium	1,40%
Phosphorus	0,28%
Sodium	9,25%
Magnesium	1,33%

USE: **IFM LYTE** enriches the horse's ration of electrolytes.

DOSAGE: **mix properly** 50-100 gr of **IFM LYTE** per day (1-2 scoops) in relation to the training, intensity of the effort and to the environment conditions.

Store in a cool and dry place.

Packaging:

Jar of Kg **6**

Sack of Kg **25**
